Potomida littoralis (Náyades)
Posición de vida, fondo del Ebro.

An underwater photograph showing the riverbed of the Ebro. The substrate is composed of fine sand and small pebbles, with patches of green algae. Several large, dark, rounded rocks are scattered across the scene. A black line is drawn across the middle of the image, with four diagonal lines extending upwards from a central point, likely indicating the position of the Potomida littoralis. The water is slightly turbid, giving the scene a greenish-yellow tint.

A group of hikers is seen from behind, walking along a narrow path in a dense, lush green forest. They are wearing backpacks and casual hiking attire. To the left of the path, a river flows through the woods. The scene is brightly lit by sunlight filtering through the trees.

**Continuamos río
arriba por las
Selvas del Huerva**
